5GH Foundation

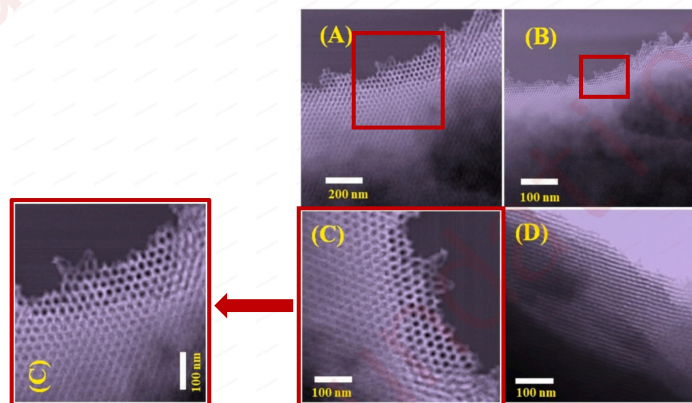

Fig. 2. The TEM images of the mesoporous inorganic silica (A, B) and organic ligand-modified composite adsorbent (C, D) with uniformly arranged pores and ordered structures.

The SEM images on Figure 2 (a), (b), and (c) were described to be taken from different samples, (a) and (b) were taken from "mesoporous inorganic silica", but (d) were taken from "organic ligand-modified composite adsorbent", however, the images on Figure 2 (a), (b), and (c) are identical to each other.
